

IOCOM LAUNCHES FIRST EVER MOBILE MULTI-PARTY VIDEO CONFERENCING APPLICATION FOR ANDROID™ DEVICES- VISIMEET

CHICAGO – March 23, 2011 – IOCOM, a leading software provider for video conferencing capabilities, announced a version of the company’s cloud based video conferencing software, Visimeet, that runs on Android™ devices. This highly collaborative multi-party mobile application is the first ever which allows mobile users to connect with room and desktop systems. IOCOM along with Wireless Innovations, a leading Sprint Business Solution Partner demonstrated the Visimeet mobile application on the HTC EVO™ and the Samsung Galaxy Tab™ to several corporations who are looking to expand their video conferencing capabilities to their mobile workforce.

The IOCOM Visimeet Android™ application allows mobile subscribers to run the Visimeet software app over wireless networks with the ability to conduct multi-party sessions in a collaborative environment. Visimeet mobile application users will be able to send and receive video and utilize collaboration tools such as chat, desktop sharing and file sharing. The mobile application will also allow users to have presence with their contact list similar to the Visimeet version which runs on any PC or Mac and connect to other Visimeet users--Android™ app. users and computer based users. With Visimeet, a session can now include room systems, desktop/laptops, mobile app users as well as phone users joining through the Visimeet conference call dialer. With Visimeet, legacy video conferencing devices can also be connected.

“We are taking video conferencing to the mobile device with the development and launch of the Visimeet Android™ application. We understand the importance of users to be able to conduct collaborative business meetings from anywhere at any time. We are excited to launch a multi-party mobile conferencing solution,” Jim Miller, CEO of IOCOM.

With the Visimeet video conferencing software, a user working from home or on the road could participate in a conference via a personal device running the Visimeet Android™ application while others could join the same meeting over other Android™ capable devices or through IOCOM’s Visimeet software for PCs or Macs. There is no need for the Visimeet Android™ user to dial a separate audio bridge as the meeting audio will be delivered through the mobile application. “As a partner of IOCOM, Wireless Innovations is excited to be offering the IOCOM Visimeet Solution to our enterprise customers. Now more than ever, our customers are looking for a cost-effective cutting edge mobile video conferencing solution that can decrease expenses and increase productivity, Visimeet is a perfect solution.” Jack Sarna, VP of Wireless Innovations.

About IOCOM

IOCOM provides software to keep people connected through video, data and audio conferencing. Its trusted solutions work with virtually any Internet-enabled device, including room systems, PCs, laptops and mobile devices. IOCOM's focus is on delivering the high performance necessary for smooth audio and video without the cost and complexity of bulkier, proprietary systems. Fortune 500 companies, government and education institutions, researchers, skilled workers, and general consumers currently rely on IOCOM's solutions.
